

The Destructive Truth Table Method with Truncation

TOP

The Method

1. Start at the bottom of the tree with an empty truth table;
2. At each gate, add its inputs to the truth table;
3. If a line in the truth table is lower than the truncation limit, add it to Delta and eliminate from the table;
4. Solve the probability for the gate;
5. Collapse the truth table by substituting the gate name for its inputs;
6. Continue up the tree.

The Claim

$P_{top} \leq P_{exact} \leq P_{top+Delta}$

Example #1 sent to us ...

Truth Table Method for Solving T = x + y			
T = x + y	Pr a	0.01	
x = a / (b + d)	Pr b	0.01	
y = d	Pr d	0.01	
Pr(d)	d	0.01 TRUE	
	d	0.99 FALSE	
Collapse for y	y	0.01 TRUE	
	y	0.99 FALSE	
expand for (b + d)	y	0.01 TRUE	
	y	0.99 FALSE	
	b d	0.00001 TRUE	
	b d	0.00099 TRUE	
	b d	0.00999 TRUE	
	b d	0.98001 FALSE	
Collapse for (b+d)	y	0.01 TRUE	
	y	0.99 FALSE	
	(b + d)	0.0199 TRUE	
	(b + d)	0.9801 FALSE	
Rename (b+d) to Z	Z	0.0199 TRUE	
	Z	0.9801 FALSE	
Expand for a / Z	y	0.01 TRUE	
	y	0.99 FALSE	
	Z	0.0199 TRUE	
	Z	0.9801 FALSE	
	a	0.01 TRUE	
	a	0.99 FALSE	
	z	0.000199 FALSE	
	z	0.009801 TRUE	
	az	0.019701 FALSE	
	az	0.980299 FALSE	
Collapse for x	y	0.01 TRUE	
	y	0.99 FALSE	
	x	0.009801 TRUE	
	x	0.980199 FALSE	
Expand for x+y	y	0.01 TRUE	
	y	0.99 FALSE	
	x	0.009801 TRUE	
	x	0.980199 FALSE	
	xy	0.00009801 TRUE	
	xy	0.00970299 TRUE	
	xy	0.09990199 TRUE	
	xy	0.98029701 FALSE	
Collapse for T	T	0.01970299 TRUE	The true value for T as calculated by Aralia is: 1.9801e-02.
	T	0.98029701 FALSE	

In this example, if $0 \leq \Delta \leq 1e-4$, then P_{exact} lies outside the upper bound: $P_{top} = (P_{top} + \Delta) \leq P_{exact}$

$\text{Pr}(\text{d})$	T	0.000029701	FALSE		

The true value for T as calculated by
Aralia is: **9.9000e-01**

So why does this happen?

Consider the two simple cases:

- 1) F+F where $p(F)=0.1$: With the method you get (even without a Delta)
 $p(F+F) = p(F)+p(F)-p(F).p(F) = 0.19$ which is an overestimation
- 2) F.F where $p(F)=0.1$: with the method you get $p(F.F) = p(F).p(F) = 0.01$ which is an underestimation.

You could argue that one can detect this repeated F case. But it is easy to hide it by taking two formulae F and F' that are structurally close, but not the same, and very far apart in the tree.

This developer has not followed the “Gate Collapse Rule” to be sure that all such cases are eliminated.

So why does this happen?

Consider the two simple cases:

- 1) $F+F$ where $p(F)=0.1$: With the method you get (even without a Delta)
 $p(F+F) = p(F)+p(F)-p(F).p(F) = 0.19$ which is an overestimation

Gate Collapse Rule

A gate g can be collapsed iff:

1. All other gates which share at least one of its inputs are in the truth table;
2. Gate g has all inputs resolved in expanded form;
3. All gates which share inputs fulfill the above two conditions.

We don't present this example to criticize the algorithm, but, rather, to show that an attempt must be made to PROVE the algorithm's correctness and limits.

We have had techniques for over 40 years to demonstrate algorithm and program correctness.

- Floyd (1967, *Assigning Meanings to Programs*)
- Hoare (1969, *An Axiomatic Basis for Computer Programs*)
- Scott & Strachey (1972, *Denotational Semantics*)

Algorithm development is a branch of mathematics.

We must concern ourselves with **accuracy** of calculations and the **proof** of such before concerning ourselves with speed. Remember, **good cooking takes the time it takes.**
